

Driveri Hub-X is an accessory to the Driveri safety camera(s), enabling fleets of any size to expand their visibility inside and outside any type of vehicle. Supporting up to four cameras, Driveri Hub-X drastically reduces your fleet's blind spots and takes the effectiveness of your safety camera program to a whole new level.

Typical deployments include buses, tractor/trailers, box trucks, garbage trucks, and other "larger" vehicles where added visibility can provide greater context for safety and exoneration purposes.

## Camera Options and Locations

### Auxillary Camera Options

For auxiliary cameras, the Hub-X offers four selections:

- Left-side camera, facing rear of vehicle
- Right-side camera, facing rear of vehicle
- Rear-facing camera, placed at the back of the vehicle/trailer
- Internal dome camera, placed on the roof/dome of the interior

### Camera Location Benefits

Depending on a fleet's requirements, deployments will include:

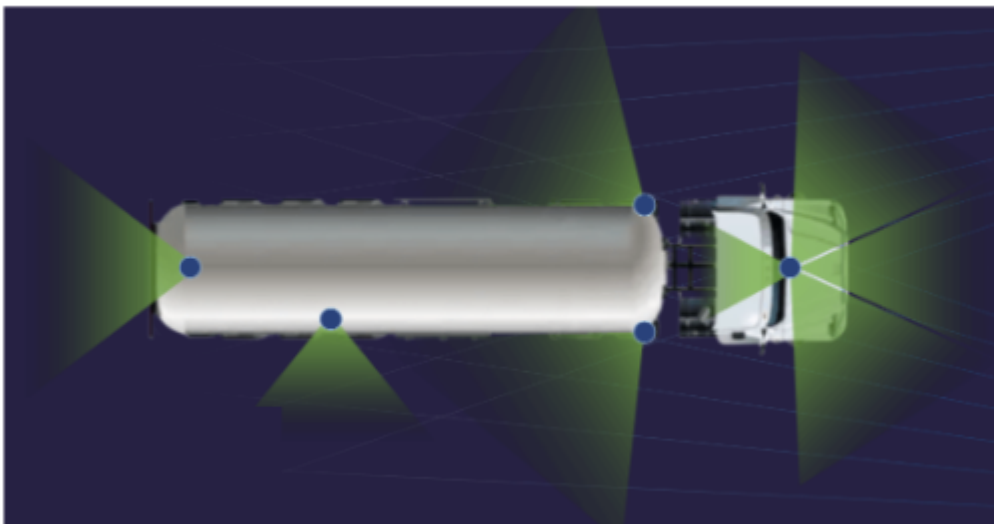

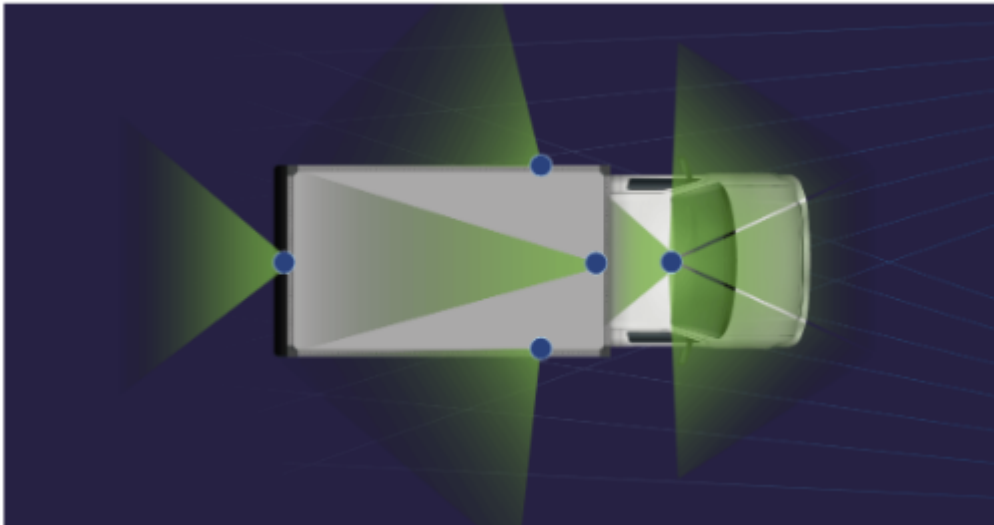

- **Left and Right-side cameras:** This orientation is great for fleets with long trailers, where wide turns can introduce potential safety or material damage concerns.
- **Rear-facing camera:** This camera orientation can be a benefit for fleets where drivers have minimal (or completely hindered) views of the rear of the vehicle for if/when they are reversing.
- **Internal camera:** This type of camera can be used in various situations, though generally we've seen this in the patient compartment of an ambulance or the storage cab of a delivery truck, to gain additional visibility into the actions taking place inside the vehicle.

## Sample Camera Orientations

## Viewing Videos

Once the Driveri Hub-X is deployed, user with appropriate permissions can see video feeds within every Driveri event-generated video, along with manual clips/requests, allowing fleets to capture the full 360° view of their vehicle/asset enabling them to take action if and when needed.
